

SPECIES MANAGEMENT PROFILE

Pomaderris pilifera subsp. *talpicutica* moleskin dogwood

Group: Magnoliophyta (flowering plants), Magnoliopsida (dicots), Rhamnales, Rhamnaceae

Status: *Threatened Species Protection Act 1995*: vulnerable
Environment Protection and Biodiversity Conservation Act 1999: Vulnerable

Endemic: Found only in Tasmania

Status:

A complete species management profile is not currently available for this species. Check for further information on this page and any relevant Activity Advice.

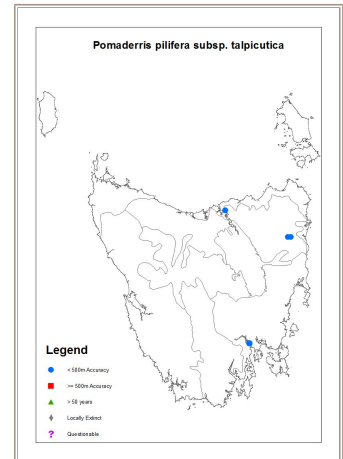

Key Points

- Important:** Is this species in your area? Do you need a permit? Ensure you've covered all the issues by checking the Planning Ahead page.
- Important:** Different threatened species may have different requirements. For any activity you are considering, read the Activity Advice pages for background information and important advice about managing around the needs of multiple threatened species.

Surveying

Key	Survey reliability more info
M	Best time to survey
M	Potential time to survey
M	Poor time to survey
M	Non-survey period

To ensure you follow the law - check whether your survey requires a permit. Always report any new records to the Natural Values Atlas, or send the information direct to the Threatened Species Section. Refer to the Activity Advice: Surveying page for background information.

<i>Pomaderris pilifera</i> subsp. <i>talpicutica</i>	Spring	Summer	Autumn	Winter
moleskin dogwood	S S O O N N	D D J J	F F M M A A	M M J J J J A A

- This small diffuse multi-branched shrub flowers from September to November but can be identified year round. The taxon is a variant of *Pomaderris pilifera* that appears to be adapted to particularly impoverished dry microsites and as such, searches would be expected to be more fruitful in similar microsites that occur adjacent to or within stands of *Pomaderris pilifera* subsp. *pilifera*.
- Pomaderris pilifera* subsp. *talpicutica* is known with certainty from two small subpopulations, in the Government Hills east of Risdon in the south of Tasmania, and close to the East Tamar Highway in the north. A third location east of Mathinna consists of a single plant in poor condition that has only been tentatively ascribed to the taxon. At East Risdon, *Pomaderris pilifera* subsp. *talpicutica* is found on the western slope of a hill within 60 to 80 m of the River Derwent and between 30 to 35 m above sea level. It occurs on Permian mudstone on very well drained skeletal soils with much broken and weathered shell debris scattered about. The taxon occurs in open shrubby woodland dominated by *Eucalyptus amygdalina*.

Permit: A permit is required under the Tasmanian *Threatened Species Protection Act 1995* to 'take' (which includes kill, injure, catch, damage, destroy and collect), keep, trade in or process any specimen or products of a listed species. Additional permits may also be required under other Acts or regulations to take, disturb or interfere with any form of wildlife or its products, (e.g. dens, nests, bones). This may also depend on the tenure of the land and other agreements relating to its management.
